

Enterprise Search

Enterprise Search MOSS2007 Implementation - Case Study

The Summary

Client wanted to empower their people with quick access to corporate information by implementing enterprise search tool. With the help of Microsoft SharePoint Server 2007 client has improved employee productivity. The Implementation of SharePoint Server 2007 created a fully functional enterprise search and enabled employee to have secure and instant information access across all organization data.

The Client

Client is one of its kind offering high quality research and recommendations to its Institutional and Retail clients. Client offer a comprehensive range of investment products and services for their customers. Some of the services they provide are Equity Broking, Derivatives, Portfolio Advisory, IPO Services, Depository Services, Mutual funds.

The Business Requirement

Client have corporate information in multiple systems like Exchange web folders, desktop, network files, Portfolio management system on Oracle , CRM system on SQL Server and Employee profile information on Active Directory. They wanted to setup enterprise search system enabling quick and robust search across corporate information.

The Solution

AG Technologies implemented SharePoint Server 2007 to fulfill business requirement of client. AG Technologies created a functional intranet enterprise search.

Highlights of the solution

- Creating multiple data catalogues and letting the user specify which to search
- Manually selecting or influencing search results
- Search by attributes (e.g., date, author) to be assigned to content sources in a systematic way so that searches can consider these attributes and arrange results accordingly
- Searching information from multiple data sources like exchange web folders, desktops, network files, Portfolio management and CRM systems.
- Best Bets, Synonyms and thesaurus for Search
